Sagemax experience

Initial situation & smile design

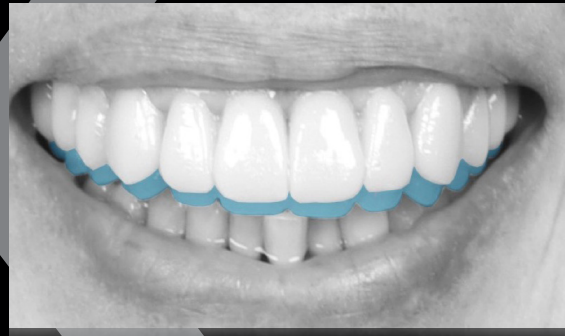

DIGITAL DESIGN

Global vertical excess of the maxilla. Periodontal disease with initial bone loss. Design adjusted with a higher positioning of implants and teeth.

TRANSFER

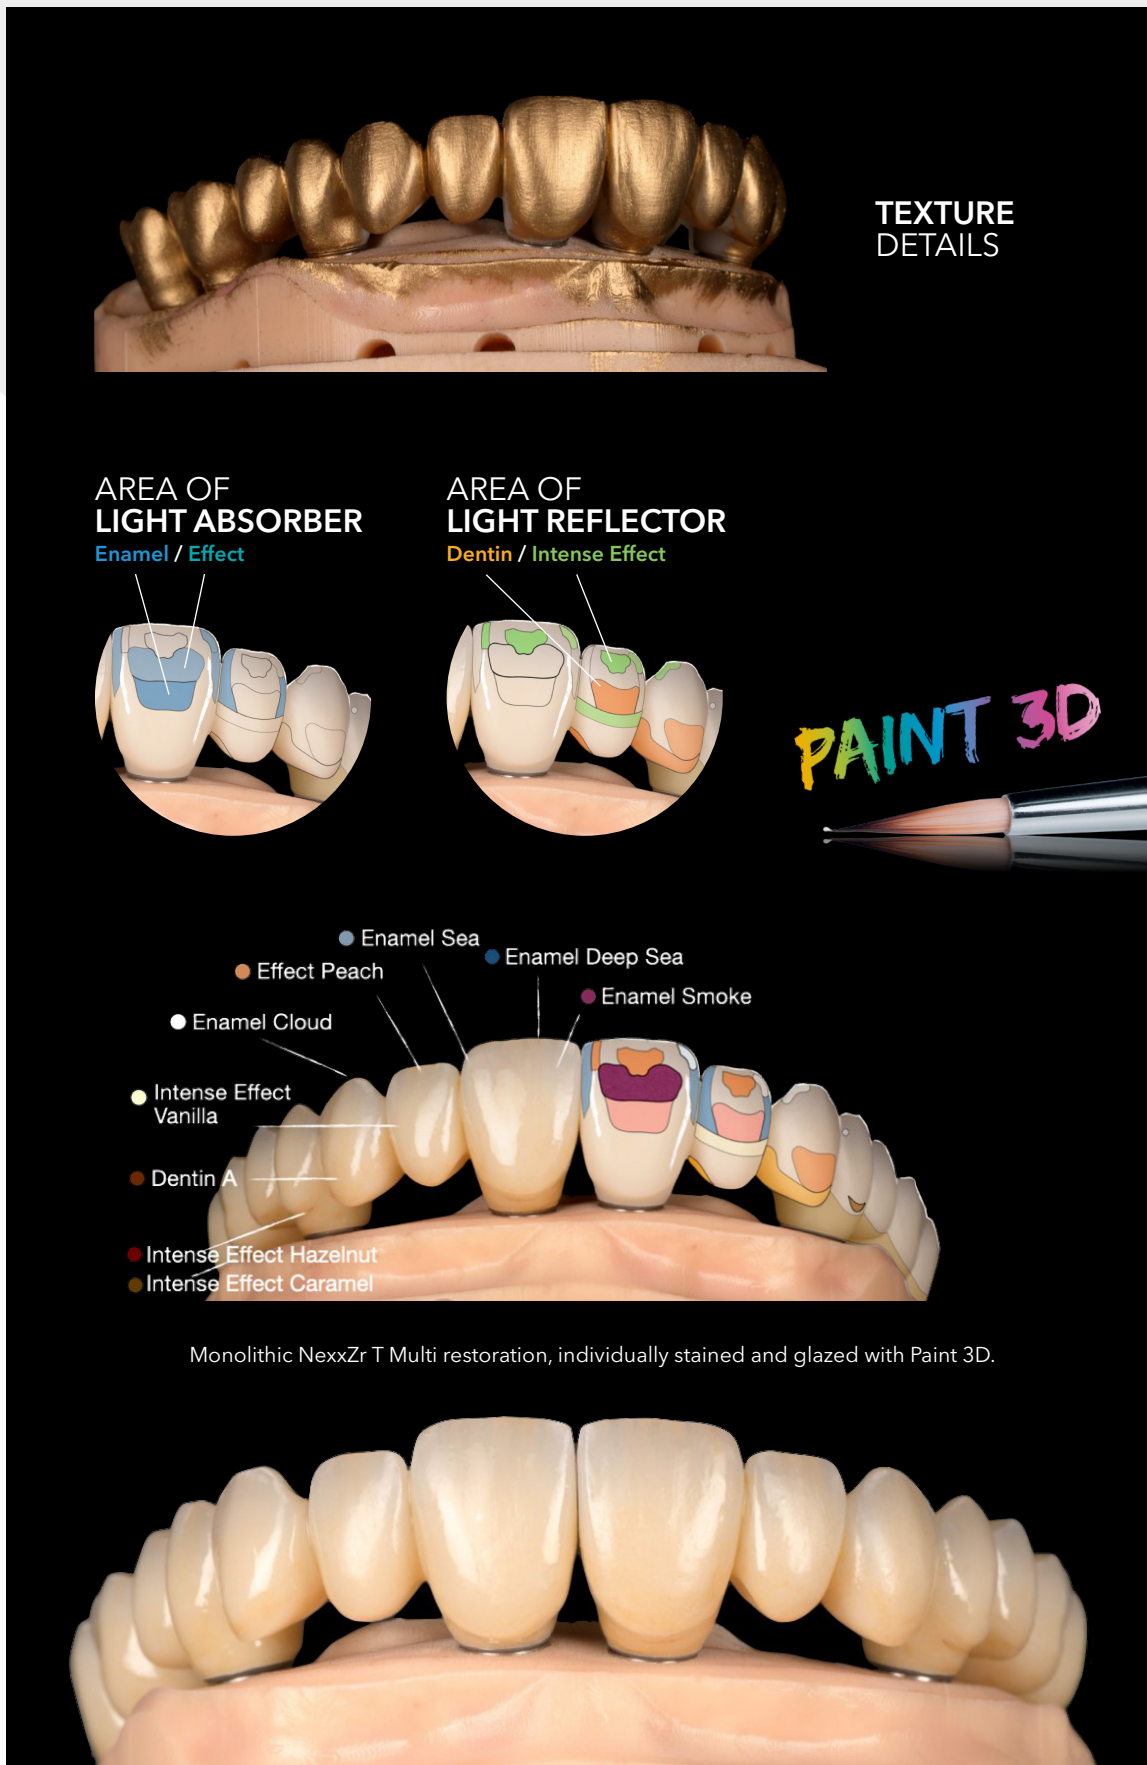

2D try-in of the design for validation of the smile line. Design of a crown-lengthening guide prior to implant placement.

GINGIVAL PROFILE

The gingival profile was defined to ensure correct three-dimensional implant positioning, alveolar ridge preservation, and placement of a temporary bridge on the day of surgery. The patient's excessive gingival tissue allowed us to avoid a gingival graft.

Paint 3D in-lab

Final result immediately after insertion

We've really enjoyed using this new Sagemax product and continue to work with it, which is a real benefit to the lab. It helps us create esthetic, artistic and realistic work. The patient was delighted with her new smile.
