Sagemax experience

Initial situation

The patient's initial situation is characterized by severely discolored teeth and a pronounced trapezoidal tooth shape.

Crown manufacturing

To enhance the patient's overall esthetic appearance, restorations made from NexxZr T Multi in a bright Bleach shade were fabricated for both the maxillary and mandibular arches. The tooth shape was individually customized to the patient and designed with a harmonious oval morphology.

Cementation

After fabrication, the crowns were subsequently cemented.

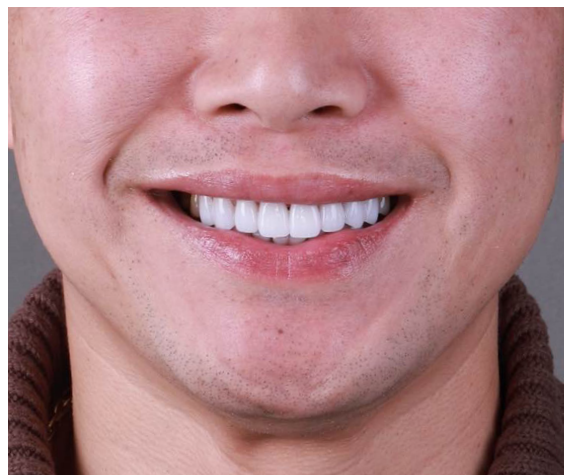

Final result

Before.

After.

The final result appears highly natural. The new tooth shape harmonizes much better with the patient's facial features, while the bright tooth shade enhances the overall attractiveness of the smile. The patient is extremely happy and grateful for his new smile.
