Manufacture of non-prep veneers

The cosmetic wax-up was created using StarWAX from Dentaurum.

The veneers were made with Opal 1 PressCeramic ingots from Sagemax.

Opal ingots combine high translucency with a strong opalescent effect - perfect as an enamel substitute for thin veneers in light tooth shades.

The veneers were finalized using IPS e.max Ceram OE1 from Ivoclar and the glaze from Shofu.

Cementation in the mouth

The non-prep veneers were subsequently inserted and adhesively bonded in the patient's oral cavity.

Final result

The final result is stunning. The veneers blend in seamlessly with the existing dentition and provide the patient with a renewed smile.
